

WHAT IS CLAIMED IS:

1 SUBA17
2

1. A method of providing an identifier for a file, said method comprising:
accessing said file;
deriving a frequency representation of said file;
providing a file name for said file;
providing said file name in a directory;
associating said frequency representation of said file with said file name so
that said frequency representation is accessible via said directory.

2. The method as described in claim 1 wherein said frequency
representation comprises a Fast Fourier Transform.

3. The method as described in claim 1 and further comprising:
configuring an address listing with an identifier for said frequency
representation.

4. A method of searching for a file, said method comprising:
obtaining a first frequency representation of a desired file;
accessing a first unknown file;
obtaining a second frequency representation of said unknown file;
comparing said first frequency representation with said second frequency
representation; and
determining from said comparing whether said unknown file is said desired
file.

5. The method as described in claim 4 wherein said obtaining said first
frequency representation of said desired file comprises:
performing a Fast Fourier Transform algorithm.

Sub A17

1 6. The method as described in claim 4 wherein said obtaining said first
2 frequency representation comprises performing a Discrete Fourier Transform.

1 7. The method as described in claim 4 wherein said comparing said first
2 frequency representation with said second frequency representation comprises:
3 comparing a range of frequencies of said first and second frequency
4 representations.

1 8. The method as described in claim 4 and further comprising:
2 decoding said unknown file.

1 9. A method of determining redundancies in a content object directory,
2 said method comprising:
3 accessing a plurality of files stored on a memory, wherein each of said files is
4 configured so as to be identified by a fingerprint;
5 for each of said files, determining said fingerprint;
6 establishing a redundancy standard so as to indicate whether any two of said
7 fingerprints of said files are redundant of one another;
8 comparing said fingerprints determined for each of said files;
9 determining redundant files based upon said comparing said fingerprints and
10 said redundancy standard.

1 10. The method as described in claim 9 and further comprising:
2 deleting at least one redundant file from said memory.

1 11. The method as described in claim 9 and further comprising:
2 utilizing a Fast Fourier Transform algorithm to compute said fingerprint.

1 12. The method as described in claim 9 and further comprising:
2 utilizing a watermark as said fingerprint.

2
3

13. The method as described in claim 9 and further comprising:
utilizing cyclical redundancy check data as said fingerprint.

14. The method as described in claim 9 wherein said accessing a plurality
of files comprises:
accessing a plurality of files comprising video data.

15. The method as described in claim 9 wherein said accessing a plurality
of files comprises:
accessing a plurality of files comprising audio data.

16. The method as described in claim 9 wherein said establishing a
redundancy standard comprises:
determining a range of frequencies in a pattern of frequencies from a Fast
Fourier Transform for comparison of said fingerprints.

17. The method as described in claim 9 and further comprising:
appending a fingerprint as metadata to at least one directory listing.

18. The method as described in claim 9 and further comprising:
cataloging in a database said fingerprint with the file from which said
fingerprint was generated.
